AAW25136 represents a Ricin A-chain ribosome inhibitory protein (RIP)
which was engineered to contain a selectively removable internal peptide
linker sequence separating the alpha and beta units of the RIP. When
separated the two units regain activity and are capable of inactivating
eukaryotic ribosomes and hence preventing protein production. Many
different RIPs may be produced with an internal linker including
maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and
Saporin. The RIPs can be used in the construction of therapeutic
toxins targeted to specific cells such as tumour cells via the
attachment of a targeting polypeptide, e.g. a monoclonal antibody.
A further use is in HIV therapy (see US486903). There is interest
in expressing RIP recombinantly in host eukaryotic cells, because of
the capacity to provide correct post-translational processing. However,
RIPs effectively inhibit protein synthesis in eukaryotic cells resulting
in cell death. Since the inactive RIP proteins are not cytotoxic to
eukaryotic cells, they can be recombinantly expressed in such cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      85 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 144

The sequences given in AAW21698-710 represent Ribosome Inactivating
Proteins (RIP's), which may be used in the construction of the
proteins possible inverse the proRIP has a selectively removable,
internal peptide linker. The precursor sequence is incapable of
inactivating eukaryotic ribosomes, but can be converted by removal
of the linker into a protein having alpha and beta fragmente and being
capable of inactivating eukaryotic ribosomes. RIPs are potent
inhibitors of eukaryotic protein synthesis. They possess a highly
specific Neglycosidaes activity which cleaves the glycosidic bond of
adenine 4324 of rat liver ribosomal 285 RNa. RIP's selectively inhibit
cellular proliferation of cells, e.g. cancer cells and HIV-infected I
cells. The inactive proRIP proteins make it possible to provide protein
possible. The RIP can be used to make cytocoxic conjugates.

The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor for form were obten using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70522) shows the nucleotide sequences of three plasmids contg. CDNA inserts obtd. by probing a CDNA library for sequences encoding ricin B using the probing a CDNA library for sequences encoding ricin B using the probing a CDNA library for sequences encoding ricin B using the probing a AAN70517. The cDNA inserts can be placed into expression vectors. Site-directed muserts can be place an ATG start codon and a HindIII site at the beginning of the mature protein (see AAN70518). The coding sequences of the inserts can be ligated into expression coding sequences of the inserts can be ligated into expression (AAN70523) and suitable retroregulators. (AAN70523) and suitable retroregulators. (AAN70523) and suitable retroregulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              62 ELSNHAELSVTLALDVTNAYVVGYRAGNSAYFFHPDNQEDAEAITHLFTDVQNRYTFAFG 121

The immunotoxin given in AAR70827 comprises the heavy and light chain variable regions of anti-lens epithelium IgG3 MAb 4197X linked to ricin-A and a hexa-histidine tag. The DNA construct encoding the immunotoxin was expressed from PHB19 in E. coli. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             145 GNYDRLEQLAGNLRENIELGNGPLEEAISALYYYSTGGTQLPTLARSFIICTQMISEAAR 204
cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. The agent is able to enter all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell unless the cell is infected with the HIV virus, where the viral protease activates it. Ricin's mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral
                                                                                                                                                  infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, Killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound

The full length sequences encoding ricin A (AAN70520), ricin D CCC (AAN70525) putative ricin E (AAN70526) and RCA (AAN70524) in precursor CCC (AAN70525) putative ricin E (AAN70526) and RCA (AAN70524) in precursor then probing the library to retrieve the desired cDNA inserts. The Library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70522), AAN70521, Shows the nucleotide sequences of three plasmids containing cDNA inserts obtained by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an ATG start codon and a HindlII site at the beginning of the mature protein, (see AAN70518). The coding sequences of the inserts can be ligated into expression containing the PDNA promoter operator and leader sequence (AAN70523) and sultable retroregularors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       156 GNYDRIBQLAGNLRENIELGNGPLEEAISALYYYSTGGTQLPTLARSFIICIQMISEAAR 215

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   36 IFPKQYPIINFTTAGATVQSYTNFIRAVRGRLTTGADVRHEIPVLPNRVGLPINQRFILV 95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This polypeptide comprises the castorbean cytotoxin, ricin.

CDNA (see AAT91638) encoding the enzymatic A domain and a portion of the A-to-B linker peptide of ricin was used to construct a ricin-diptheria toxin B' interleukin-2 gene that was expressed in B. coli. The hybrid protein can be isolated and used to treat conditions involving over-production of cells bearing IL2 receptors, such as certain T-cell lymphomas and organ transplant rejection crises. The hybrid inactivates ribosomes in cells bearing IL2 receptors, resulting in cessation of protein synthesis and death of target cells. Claimed hybrid proteins comprise a translocation or polypeptide toxin. The hybrid molecules can be used for the delivery of agents (e.g. therapeutic genes, toxins, detectable claimed will be effective in relatively low doses, since a that the hybrid will be effective in relatively low doses, since a chigh proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 IFPKOYPIINFTTAGATVQSYTNFIRAVRGRLTTGADVRHEIPVLPNRVGLPINQRFILV

```

protein comprising three parts: (a) the first part comprises a nybrid protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein celeted from diphtheria toxin, botulinum neurotoxin, ricin, cholera toxin, IT toxin, C3 toxin, shiga-like toxin, pertussis toxin and tetanus toxin, in toxin, c3 toxin, shiga-like toxin, pertussis toxin and tetanus toxin, which translocate the third part of the across the cytoplasmic membrane into the cytosol of the call; and (c) the third part comprises a polypeptide entity to be introduced into the cell, which is non-native to the naturally occurring protein of (b). This sequence represents the castor bean ricin toxin sequence for use in generating the hybrid of the invention. The hybrid molecule enables the direction of appropriate therapy to affected cells, allowing them to function properly and calleviate or cure the diseases. The hybrid is especially used in treating genetic deficiency diseases, by delivering to affected cells an enzyme supplying the missing function, to supplementing cellular levels of a particular enzyme or a scarce precence or cented contains and the call of the contains to other noisons to desire precures or a scarce precence or each active or a scarce precence or each active or a scarce precence or each active or a scarce precence or a scarce or other poisons to destroy particular cells (such as adipocytes, cancer cell, or virus infected-cells), to counteracting viral infections such as HIV, by introducing appropriate antibodies to viral proteins. It is also involved in the process of getting non-therapeutic substances such as detectable labels into cells. The invention relates to a recombinant DNA molecule encoding a hybrid

Example 4; Fig 11; 31pp; English.

Murphy JR;

WPI; 2000-160390/14. N-PSDB; AAZ90019. New two-part hybrid protein comprising a translocation domain and a cell-binding domain, for treating genetic deficiency diseases, cancer and HIV infections

Example 4; Fig 11; 32pp; English.

This sequence represents the Ricinus communis ricin protein sequence. The toxin can be included in the hybrid protein of the invention and used to destroy or modify the cell that the hybrid protein is targeted to. The hybrid protein comprises a first part which is a portion of the binding domain of a cell-binding ligand, effective to cause the hybrid molecule to bind to a cell of an animal. The second part comprises a portion of a translocation domain of a naturally occurring protein (e.g. the translocation domain of diphtheria toxin) the second part translocates the third part across the cytoplasmic membrane and into the cytosol of

```
the cell. The third part comprises a chemical entity to be introduced into the cell, where each of the first and third part is non-native with respect to naturally occurring protein, and the covalent bond attaching the second and third part is cleavable. The toxin represented by the present sequence can form part of the third portion of the hybrid protein. The cell binding domain binds to a specific cell and the translocation domain transfers the hybrid molecule across the cell membrane into the cytosol. The third part of the protein, linked to the translocation domain through a cleavable bond, can then carry out its translocation domain through a cleavable bond, can then carry out its function. The hybrid molecules are useful for treating genetic deficiency diseases by delivering to affected cells an enzyme supplying the missing function, to supplement cellular levels of a particular enzyme or a cearce precursor or cofactor, to direct toxins or other poisons to destroy particular cells (such as adipocytes, cancer cells, or virus-infected cells), and to counteract viral infections such as HIV by
                                                                                                                                                                                                                                                                                                                                                                                        0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1, Ag

Sequence 1, Application US/08839765
Patent No. 6146631
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Carroll, Stephen F.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
CORRESPONDENCE ADDRESS:
ADDRESSEE: MCANGREW, Held & Malloy, Ltd.
                                                                                                                                  Length 267;
                                                                                                                                                                                            0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CURRENT APPLICATION DATA:

Sequence 1, Application US/08646360

Patent No. 5837491

GENERAL INFORMATION:

APPLICANT: Better, Marc D.

APPLICANT: Carroll, Stephen F.

APPLICANT: Studnika, Gary M.

TITLE OF INVENTION: Immunotoxing Comprising Ribosome-Inactivating

TITLE OF INVENTION: Proceins
                          0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CURRENT APPLICATION DATA:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A) Title: Structure of ricin A-chain at 2.5 angstroms.

A) Conment: The functional molecule is a disulfide-linked dimer of A and B chains, which C; Comment: The A chain inhibits protein synthesis; it inactivates the 60S ribosomal subtoon to call of the A chain; B chains are also responsible for cell agglutination (lecting the call of the A chain; B chains are also responsible for cell agglutination (lecting C; Comment: This protein is cytotoxic and very poisonous to animals.

C; Comment: This protein is cytotoxic and very poisonous to animals.

July precursor - Indian licorice (fragment)

N; Contains: RRN N-Gyycosidase (EC 3.2.2.2)
C; Species: Abrus precatorius (Indian licorice)
C; Species: Abrus precatorius (Indian licorice)
C; Species: Abrus precatorius (Indian licorice)
C; Accession: S32430; JC1399
C; Accession: S32430; JC1399

C;Comment: Abrin-a is more toxic than ricin. The toxin consists of an A chain, which intending receptors on the cell surface. The A and B chains are linked by a single disulfit caining receptors on the cell surface. The A and B chains are linked by a single disulfit c;Superfamily: ricin; FirAN N-91ycosidase homology.
